Analisis Factorial_state

Horacio Alberto Miranda Lopez

2022-06-06

#ANALISIS FACTORIAL

#1.- Lectura de la matriz de datos

```
x<-as.data.frame(state.x77)
```

#2.- Quitar los espacios de los nombres

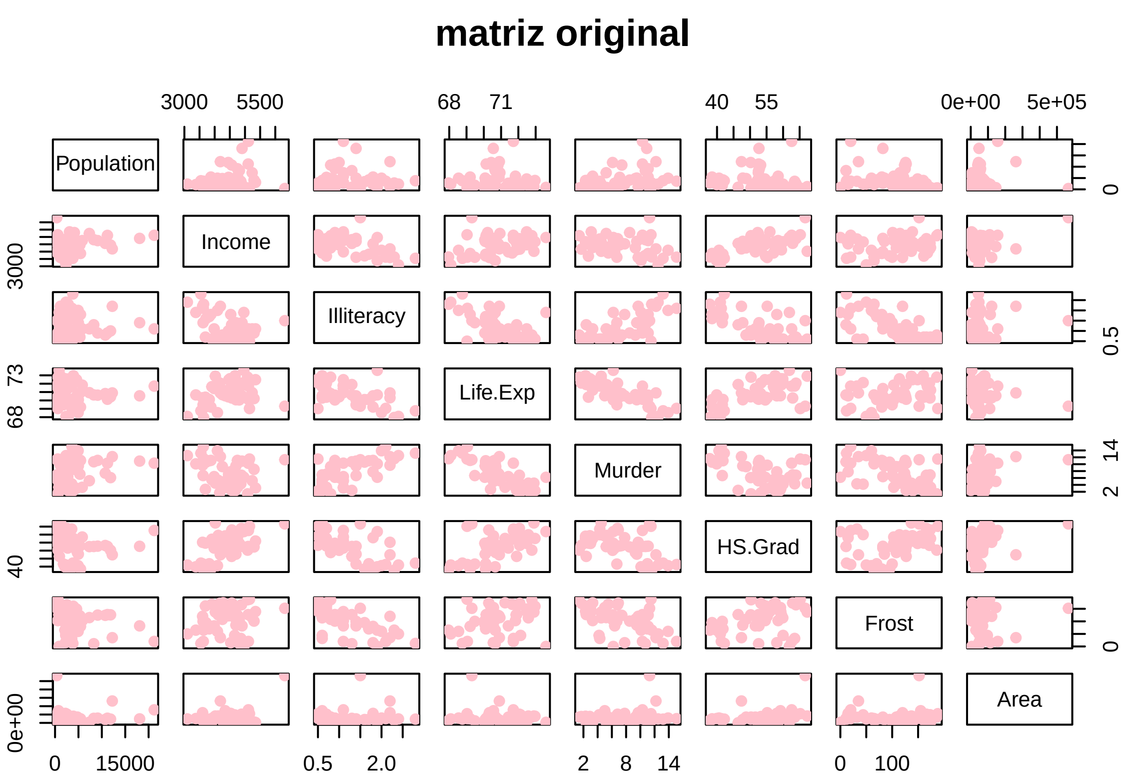
```
colnames(x)[4]="Life.Exp"
colnames(x)[6]= "HS.Grad"
```

#3.- Separa n (estados) y p (variables)

```
n<-dim(x)[1]
p<-dim(x)[2]
```

#4.- Generacion de un scater plot para la # visualización de variables originales

```
pairs(x, col="pink", pch=19, main="matriz original")
```



Transformación de alguna varibles

#1.- Aplicamos logaritmo para las columnas 1,3 y 8

```
x[,1]<-log(x[,1])
colnames(x)[1]<-"Log-Population"

x[,3]<-log(x[,3])
colnames(x)[3]<-"Log-Illiteracy"

x[,8]<-log(x[,8])
colnames(x)[8]<-"Log-Area"
```

Grafico scater para la visualizacion de la matriz original con 3 variables que se incluyeron

```
pairs(x,col="burlywood", pch=19, main="Matriz original")
```

Nota: Como las variables tiene diferentes unidades de medida, se va a implementar la matriz de correlaciones para estimar la matriz de carga

Reduccion de la dimensionalidad

Análsis Factorial de componentes principales (PCFA)

#1.- Calcular la matriz de medias y de correlaciones # Matriz de medias

```
mu<-colMeans(x)
mu
```

```

Estimacion de la matriz de carga

Nota: se estima la matriz de carga usando los

autovalores y autovectores.

se aplica la rotación varimax

Primera estimación de Lamda mayuscula

se calcula multiplicando la matriz de los

3 primeros autovectores por la matriz diagonal

formada por la raiz cuadrada de los primeros

3 autovalores.

```
L.est.1<-eigen.vec[,1:3] %*% diag(sqrt(eigen.val[1:3]))
L.est.1
```
